## Quality policy

### *Our Major postulates*

*- We highly regard our customers, we understand their needs and expectations as well as the needs and expectations of our deliverers, employees, owners and society.*

*We coordinate our efforts with intention to completely satisfy all sides and to reach best performance.*

*- We continuously create and develop a unique vision of our company, by increasing key values when it comes to our employees behavior, in order to make our vision come true.*

*- We constantly include our employees in company development, we use their knowledge, experience and ideas, and we recognize their contribution by creating more suitable environment motivating them to reach their full potential.*

*- We fully accept “process approach” in our business management and we run our processes as with unique system of mutually connected processes, which leads us to a company goals come true.*

*- We provide certain environment in which every person is motivated to constantly increase its efficiency and effectiveness of our products, processes and our managing system, with maximal use of their knowledge and experience and motivation for their continuous promotion.*

*- We establish our decision on logical and intuitive analysis of gathered data, measuring precisely our products characteristics, processes and system.*

*- We develop strong relationships with our deliverers and work with them side by side thus reaching better performance.*

*- We coordinate and develop our company business and management according to domestic and world standards with respect to law regulative and protection of environment.*

# Mechanical seals

The function of a mechanical seal is to prevent the loss of media and to:

- protect environment
- protect the expensive equipment
- stop lose the expensive media

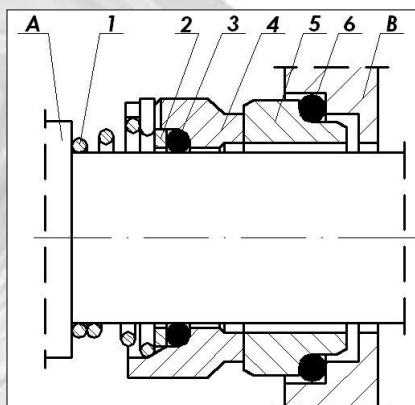

Therefore, designing of mechanical seal doesn't allow mistakes.

Whether it is refinery, chemical process pump, mixer, boiler feed pump, pump in brewery or food industry, mechanical seal is very important for safety and efficiency

All mechanical seal components must be selected and applied properly, but most important are seal faces.

Seal faces are always exposed to the product, which may be:

- at very high or low temperature
- corrosive
- abrasive
- flammable, etc

## Seal components:

- A - shaft
- B - housing
- 1 - spring
- 2 - thrust ring
- 3 - O-ring
- 4 - rotating seal face
- 5 - stationary seat
- 6 - O-ring

Seal face material	advantages	disadvantages
Carbon-graphite (A,B,C)	corrosion resistance selflubricity acceptable price	low abrasion resistance
Silicon carbide (Q1, Q2,Q11)	abrasion resistance stiffness corrosion resistance high PV value	brittleness high price
Tungsten carbide (U1,U2)	toughness abrasion resistance stiffness	low corrosion resistance high price
Alumina ( $\text{Al}_2\text{O}_3$ ) (V)	abrasion resistance stiffness	thermal shock
Metal	simple machining low price stiffness toughness	low PV values

## Mechanical seal types

---

Mechanical seals with conical rotating spring

- NT - 1 (Mechanical seal with single rotating spring)
  - NT - 2 (Mechanical seal with single rotating spring)
- 

Mechanical seals with springs in metal case

- NV - 1 (Mechanical seal with multiple rotating springs)
  - NV - 2 (Mechanical seal with single spring)
  - NV - 3 (Mechanical seal with wave spring)
- 

Elastomer bellows mechanical seals

- NM - 1 (Elastomer bellows mechanical seal)
  - NM - 2 (Elastomer bellows mechanical seals)
- 

Metal bellows mechanical seal

- NMM - 1
- 

PTFE bellows mechanical seal

- CHEM NM - 3
- 

Mechanical seal for aggressive media

- CHEM NV - 4
- 

Balanced mechanical seals

- BT - 1 (Balanced mechanical seal with single rotating spring)
  - BV - 1 (Balanced mechanical seal with multiple rotating springs)
  - BV - 2 (Balanced mechanical seal with multiple rotating springs)
-

- Mechanical seal, type NT-1 is mostly used for circulating water pumps and heating systems, pumps for milk, beer, juice etc.
- Seal faces materials depend on working conditions and pumping media
- Secondary sealing by O-rings
- Other metal parts Cr-Ni steel

**Face materials:****Rotating seal:**

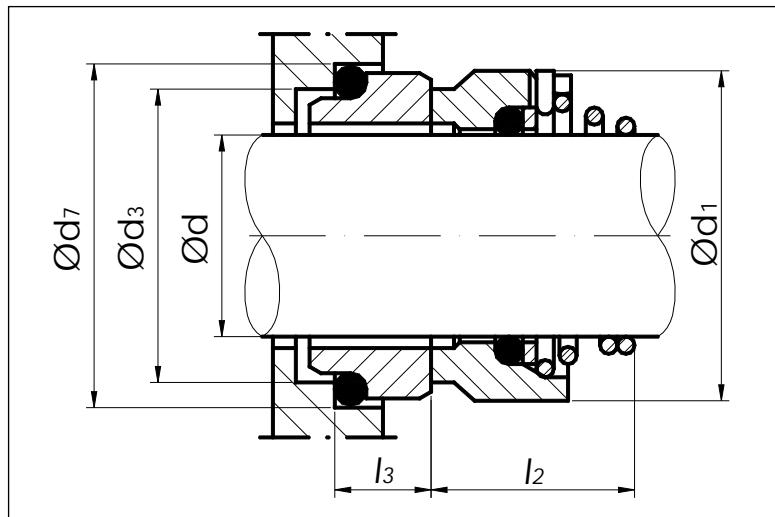

- carbon-graphite

**Stationary seal:**

- Cr - steel
- Cr - Ni steel
- Cr - Ni steel hard faced
- tungsten carbide
- silicon carbide
- Cr cast
- alumina ( $\text{Al}_2\text{O}_3$ )

**Operating limits:**

- $p = 10$  bar
- $t = -20 \dots 180^\circ\text{C}$
- $v = 15$  m/s

<b>d</b>	<b>d<sub>1</sub></b>	<b>d<sub>3</sub></b>	<b>d<sub>7</sub></b>	<b>l<sub>2</sub></b>	<b>l<sub>3</sub></b>

*On the customer's request other dimensions could be supplied*

**Face materials:**

- carbon-graphite
- Cr - steel
- Cr - Ni steel
- Cr - Ni steel hard faced
- tungsten carbide
- silicon carbide
- alumina ( $\text{Al}_2\text{O}_3$ )

**Operating limits:**

- $p = 10$  bar
- $t = -20 \dots 180^\circ\text{C}$
- $v = 15$  m/s

– Mechanical seal type NT-2 is mainly used in submerged pumps, sewage pumps and water pumps; very rugged and reliable

– Combination of seal faces materials is designed for working condition and pumping media

– Secondary sealing: O-ring

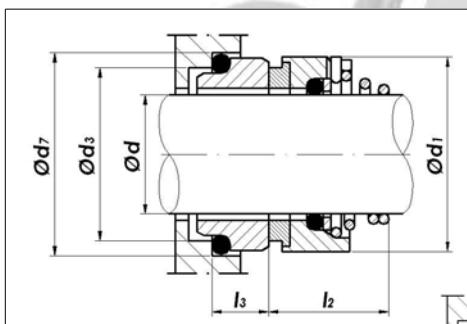

– Other construction parts Cr-Ni steel

*On the customer's request other dimensions could be supplied*

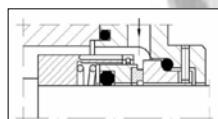

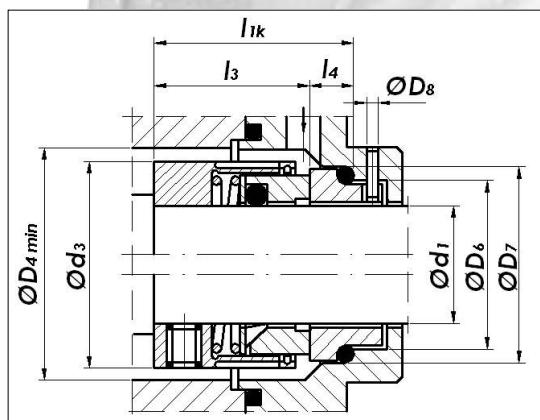

- Mechanical seal type NV - 2 is very similar to seal type NV - 1. The main difference is single spring instead of multiple springs. Reason is usage in high viscous media or media containing solids.
- Mechanical seal design with single spring prevents sticking and blocking of small multiple springs.
- Seal is very easy and cheap to repair.

# NV-3

DIN 24960

## Mechanical seal with wave spring

- Wave spring mechanical seal type NV - 3 is very similar to seal types NV - 1 and NV - 2. Main difference is the wave spring instead of multiple springs or single spring. Reason is usage in high viscosity media or media containing solids.
- Mechanical seal design with wave spring prevents sticking and blocking of small multiple springs. Another advantage of wave springs is more uniform force on the seal face.
- A steep characteristics curve makes wave springs more sensitive and allow small axial space requirements.

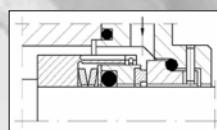

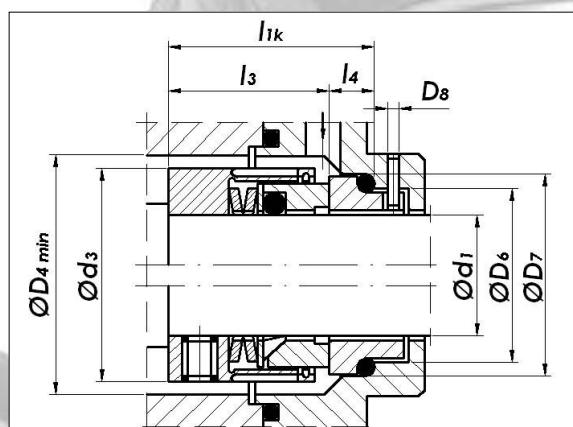

### Face materials:

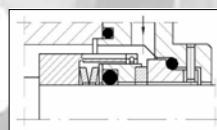

- carbon-graphite
- Cr - steel
- Cr - Ni steel
- Cr - Ni steel hard faced
- tungsten carbide
- silicon carbide
- alumina ( $\text{Al}_2\text{O}_3$ )

### Operating limits:

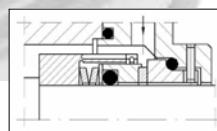

- $p = 16$  bar
- $t = -40 \dots 220^\circ\text{C}$
- $v = 20$  m/s

## Elastomer bellow mechanical seals

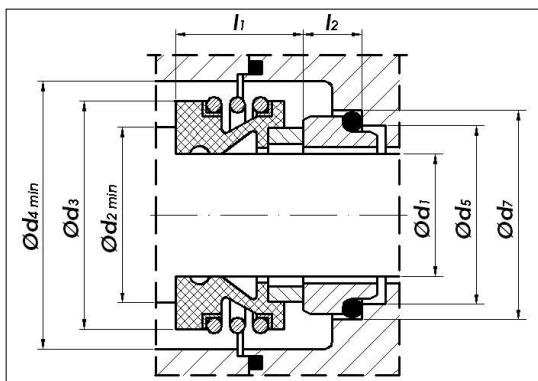

Elastomer bellow mechanical seals design is a very popular type of mechanical seals. Relatively cheap production introduces this type of mechanical seals as the bestseller among the all types. The main advantage of this design is that there is no elastomer with axial moving on the shaft. Bellow is secondary seal on the shaft, and it stands still all the time when you fix it. Design of the bellow allows to have shaft with lower surface finish. Fixing of the rotating part of the seal couldn't cause any damage on the shaft. Because of this big spring, dirt and solids in media couldn't cause failure of the seal. Its design is without any bonded parts, and because of this reparation of the seal is very easy and cheap.

- Design with elastomer bellows is frequent and among most commonly used
- NM-1 type has got very good secondary sealing on a shaft with elastomer bellows
- This type is highly recommended for sealing media with possibility of crystallization or containing solids in waste water or sewage application
- Constructions allow fast and cheap reparation because there is no boned joints
- NM-1 seals don't depend on the direction of shaft rotation
- All other metal parts are made of stainless steel

- v = 10 m/s

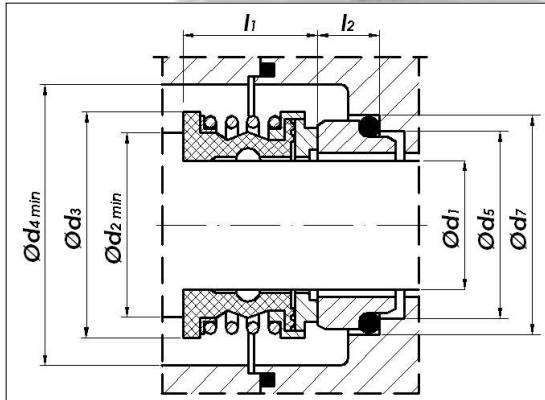

# NM-2

DIN 24960

## Elastomer bellows mechanical seal

- NM-2 type is very similar to NM-1 type
- Design of NM-2 allows excessive shaft end play and there is no possibility for the seal face to rotate in elastomer bellow holder
- Construction allows fast and cheap reparation because there are no bended joints
- All other metal parts are made of stainless steel
- All measures meet DIN 24960 standard

### Face materials:

- carbon-graphite
- Cr - steel
- Cr - Ni steel
- Cr - Ni steel hard faced

# NMM-1

## Metal bellows mechanical seal

Metal bellow mechanical seal has a very wide field of application, but because of high price we use it for extreme conditions, like very high temperature, aggressive and dirty media.

Main advantage is that there is no dynamic O-ring or elastomer part. All elastomer parts have a high temperature usage limit, and when it is passed, mechanical seal failed. Metal bellow mechanical seals work in high temperature, high aggressive and high viscosity media without fail. Because of metal bellows design, seal could work with media containing solids.

### Face materials:

- carbon-graphite
- Cr - steel
- Cr - Ni steel
- silicone carbide
- tungsten carbide
- ceramics ( $\text{Al}_2\text{O}_3$ )

### Operating limits:

- $p = 15 \text{ bar}$
- $t = -40 \dots 220^\circ\text{C}$
- $v = 25 \text{ m/s}$

# CHEM NM-3

## PTFE bellows mechanical seal

Mechanical seal metal part incompatibility to media is common problem when sealing aggressive, corrosive media. Mechanical seal type CHEM NM-3 with no metal parts in contact with media is strongly recommended and common choice in chemical industry. Poor resistance of elastomers to acids is avoided by application of PTFE bellow. Mechanical seals type CHEM NM-3 are independent on direction of shaft rotation. Seal arrangement enables maximum fluid film stability. Seal arrangement and choice of seal faces material make mechanical seal type CHEM NM-3 best choice for sealing aggressive corrosive media.

### **Face materials:**

#### **Stationary seat:**

- carbon-graphite
- silicone carbide
- ceramics ( $\text{Al}_2\text{O}_3$ )

#### **Rotating seal:**

- PTFE glass impregnated
- PTFE carbon impregnated

#### **Operating limits:**

- $p = 8$  bar
- $t = -40 \dots 160^\circ\text{C}$
- $v = 10$  m/s

# BT-1

## Balanced mechanical seal with rotating spring

DIN 24960

When we are designing the mechanical seal with sleeve on a shaft or making a stepped shaft, we balance the forces which are acting on the sliding surfaces. By that we could arrange higher P-v values. We call this the "balanced mechanical seal"

- BT-1 type is mostly used in water pumps and central heating pumps and it's very rugged and reliable
- Combination of seal face materials is designed for working condition and pumping media
- Secondary sealing by O-ring
- Other construction parts are made of stainless steel

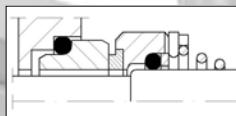

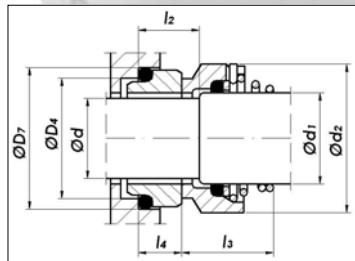

### Face materials:

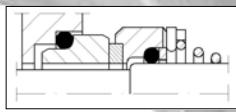

- carbon-graphite
- Cr - steel
- Cr - Ni steel
- Cr - Ni steel hard faced
- tungsten carbide
- silicon carbide
- alumina ( $\text{Al}_2\text{O}_3$ )

### Operating limits:

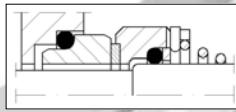

- $p = 25$  bar
- $t = -20 \dots 180^\circ\text{C}$
- $v = 15$  m/s

BT-1.1 Carbon graphite seal face shrink-fitted into the seal face housing

BT-1.2 Silicon carbide seal face shrink-fitted into the seal face housing

BT-1.3 Tungsten carbide seal face brazed into the seal face housing

In BV-2 seal design springs are not emerged in operating fluid. In that manner spring blocking and material incompatibility problems are eliminated.

In BV-2 seal design rotating part O-ring is in static state all the time, even during operation. Seal face wear is compensated by springs, therefore O-ring is never under dynamical load.

Mechanical seal type BV-2 can be applied in conditions of pressure up to 40 bar due to shaped seal face cross-section.

Standardized seal face dimensions allowe simple application of wide range of seal face materials and easy component replacement.
