# Standard cylinders DNC, to ISO 15552

Key features

**FESTO**

## At a glance

DIN

- Standards-based cylinders to ISO 15552 (corresponds to the withdrawn standards ISO 6431, DIN ISO 6431, VDMA 24 562, NF E 49 003.1 and UNI 10290)

- The modern design and construction save up to 11% fitting space compared to ordinary standard cylinders, thus permitting a considerably more compact system design

- An extensive range of accessories makes it possible to install the cylinder virtually anywhere
- The widest range of variants on the market provides the right DNC cylinder for every application

## Design features

- Socket head screw with female threads for mounting attachments

- Broad range of accessories

- Additional cushioning rings in the end positions for absorbing the residual energy from high speeds and machine cycles

- No protruding proximity sensors thanks to profile slots

- Smooth, closed surface using slot covers for the sensor slots (protects the sensor cable and keeps dirt out of the profile slots)

## Cylinder with clamping units

DNC-KP

- Piston rod can be held or clamped in any position
- The piston rod can be held in position for long periods even with alternating loads, fluctuating operating pressure or leaks in the system

DNC-E

- Suitable for use in safety-related control systems in compliance with EN 954-1, EN 1050, EN 292 and EN 983
- Fail-safe
- Piston rod can be clamped in any position

## Cylinder with end-position lock

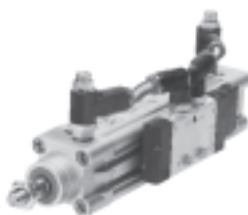

DNC- ... -EL

- Mechanical lock when the end position is reached
- Lock is only automatically released when pressure is supplied to the cylinder
- End-position lock at one or both ends

## Cylinder/valve combination

DNC-V1 ... V6

- The cylinder/valve combination is assembled and fitted with tubing ready for connection
- Particularly suitable for decentralised use in larger systems

## Tandem cylinder

DNCT

- Connection of 2 cylinders with the same piston Ø and stroke in series
- Double the thrust and return force in comparison to a standard cylinder

# Standard cylinders DNC, to ISO 15552

FESTO

Key features

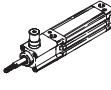

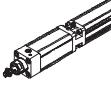

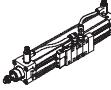

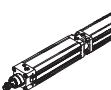

Variants from the modular product system		
Symbol	Key features	Description
	S2 Through piston rod	For working at both ends with the same forces in the advance and return stroke, for attaching external stops
	S6 Heat-resistant seals up to max. 120 °C	Temperature resistance
	S10 Constant operation at low piston speeds	Suitable for slow stroke movements at a constant, judder-free speed over the full stroke of the cylinder. Seal contains silicone grease (not free of paint-wetting impairment substances)
	S11 Low friction	The special seals considerably reduce system wear. This corresponds to a considerably lower response pressure. Seal contains silicone grease (not free of paint-wetting impairment substances)
	S20 Through, hollow piston rod	For carrying vacuum, small parts, media, etc.
	K2 Extended male piston rod thread	–
	K3 Female piston rod thread	–
	K5 Special piston rod thread	Metric standard thread to ISO
	K7 Piston rod with external hexagon	Special spanner flats
	K8 Extended piston rod	–
	K10 Smooth anodised aluminium piston rod	Ideal for use in welding environments: – Protection against welding spatter – Small moving loads – Harder surface compared to steel – Long service life
	KP With clamping unit	Integrated clamping unit on the piston rod
 CT-free	CT Free of copper, PTFE and silicone	–
	EL With end-position lock	Positive lock in the end position as drop guard. If there is a drop in pressure, the piston rod is secured in its end position to prevent it from dropping
	Q Square piston rod	Protection against rotation. For correctly oriented feeding
	R3 High corrosion protection	All external cylinder surfaces comply with corrosion resistance class 3 to Festo standard 940 070. The piston rod is made from corrosion and acid resistant steel
	R8 Dust protection using wiper seals	The cylinder is equipped with a hard-chrome plated piston rod and a rigid wiper seal, which protects against dry, dusty media
	TT Low temperature	Temperature resistance

Certification	Germanischer Lloyd													

- 1) Note operating range of proximity sensors  
 2) Corrosion resistance class 2 to Festo standard 940 070  
 Components subject to moderate corrosion stress. Externally visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment or media such as coolants or lubricating agents.  
 Corrosion resistance class 3 to Festo standard 940 070  
 Components requiring higher corrosion resistance. External visible parts in direct contact with industrial atmospheres or media such as solvents and cleaning agents, with a predominantly functional requirement for the surface

## 1.2

Forces [N] and impact energy [J]							
Piston Ø	32	40	50	63	80	100	125
Theoretical force at 6 bar, advancing	483	754	1,178	1,870	3,016	4,712	7,363
	S2/S20	415	633	990	1,682	2,721	4,418
Theoretical force at 6 bar, retracting	415	633	990	1,682	2,721	4,418	6,881
	S2/S20	415	633	990	1,682	2,721	4,418
Max. impact energy at the end positions <sup>1)</sup>	0.1	0.2	0.2	0.5	0.9	1.2	5

- 1) The permitted impact energy is reduced by approx. 10% for variants K10 and S20

Permissible impact velocity:

$$v_{\text{perm.}} = \sqrt{\frac{2 \times E_{\text{perm.}}}{m_{\text{dead}} + m_{\text{load}}}}$$

- - Note

This data represents the maximum values that can be achieved. Values will vary in practice depending on the size of the effective load. Allowance

must also be made for the limits of the cushioning capacity of the drive and the permissible impact energy.

Maximum permissible load:

$$m_{\text{load}} = \frac{2 \times E_{\text{perm.}}}{v^2} - m_{\text{dead}}$$

## Operating and environmental conditions

Operating medium	Filtered compressed air, lubricated or unlubricated
Operating pressure [bar]	1.5 ... 10
Min. release pressure [bar]	3
Ambient temperature <sup>1)</sup> [°C]	-10 ... +80
Corrosion resistance class CRC <sup>2)</sup>	2
Certification	Germanischer Lloyd

1) Note operating range of proximity sensors

2) Corrosion resistance class 2 to Festo standard 940 070

Components subject to moderate corrosion stress. Externally visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment or media such as coolants or lubricating agents

# Standard cylinders DNC-KP, standard port pattern, with clamping unit

Technical data

**FESTO**

Impact energy [J]							
Piston Ø	32	40	50	63	80	100	125
Max. impact energy at the end positions	0.1	0.2	0.2	0.5	0.9	1.2	5

Permissible impact velocity:

$$v_{\text{perm.}} = \sqrt{\frac{2 \times E_{\text{perm.}}}{m_{\text{dead}} + m_{\text{load}}}}$$

Note

This data represents the maximum values that can be achieved. Values will vary in practice depending on the size of the effective load. Allowance

must also be made for the limits of the cushioning capacity of the drive and the permissible impact energy.

Maximum permissible load:

$$m_{\text{load}} = \frac{2 \times E_{\text{perm.}}}{v^2} - m_{\text{dead}}$$

Forces [N]							
Piston Ø	32	40	50	63	80	100	125
Theoretical force at 6 bar, advancing	483	754	1,178	1,870	3,016	4,712	7,363
S2	415	633	990	1,682	2,721	4,418	6,881
Theoretical force at 6 bar, retracting	415	633	990	1,682	2,721	4,418	6,881
S2	415	633	990	1,682	2,721	4,418	6,881
Static holding force	600	1,000	1,400	2,000	5,000	5,000	7,500

Note

The specified holding force refers to a static load. If this value is exceeded, slippage may occur. Dynamic forces occurring during operation must not

exceed the static holding force. The clamping unit is not backlash-free in the clamped condition if varying loads are applied to the piston rod.

Activation:

The clamping unit may only be released if the forces at the piston have reached equilibrium. Otherwise, there is a risk of accidents due to

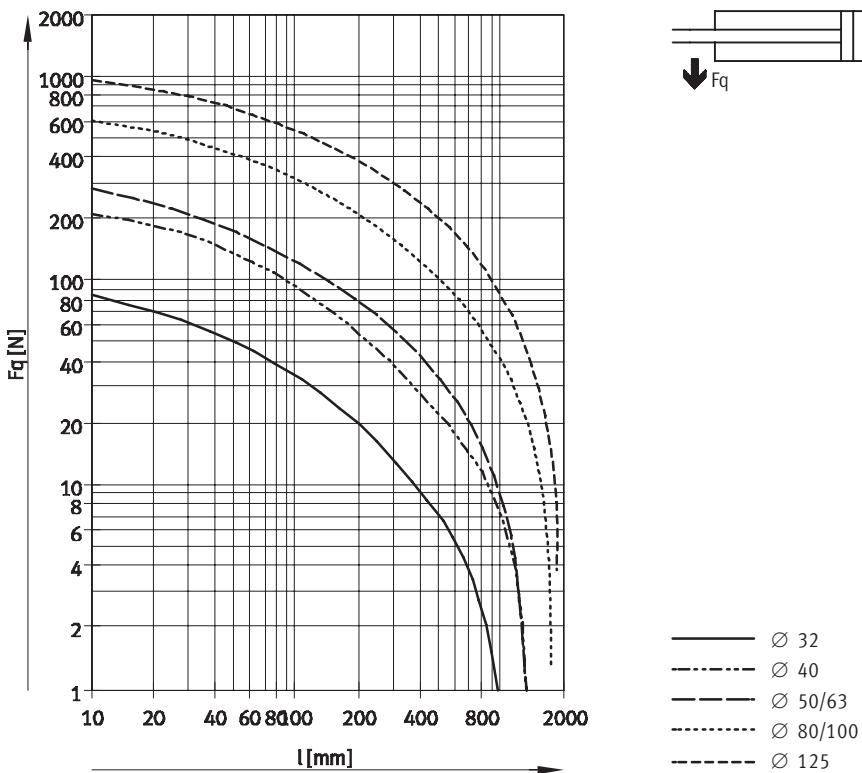

sudden movement of the piston rod. Blocking off the air supply at both ends (e.g. with a 5/3-way valve) does not provide any safety.

# Standard cylinders DNC-KP, standard port pattern, with clamping unit

FESTO

Technical data

## Dimensions – Variants

Q – Square piston rod

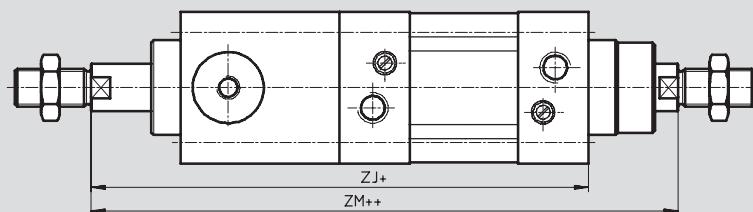

- - Note

Clamping unit and variant Q only in combination with S2

Download CAD data → [www.festo.com/en/engineering](http://www.festo.com/en/engineering)

## S2 – Through piston rod

+ = plus stroke length  
++ = plus 2x stroke length

- - Note

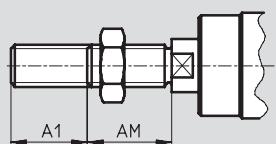

The thread types at both piston rod ends are identical.

In combination with variant Q, the left-hand piston rod is round, the

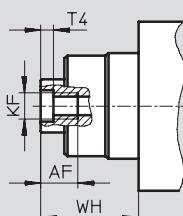

right-hand piston rod square. The clamping unit is mounted on the

left-hand, round piston rod.

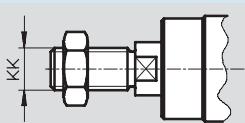

## K2 – Extended male piston rod thread

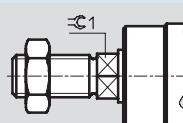

## K3 – Female piston rod thread

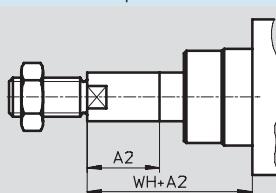

## K5 – Special piston rod thread

## K7 – Piston rod with external hexagon

## K8 – Extended piston rod

- - Note

In combination with variant S2, the piston rod is extended at one end. The clamping unit is mounted on the

side of the piston rod that is not extended. If variant Q is also

required, the extension will only be added to the square piston rod.

Mounting orientation		Any				

- | - Note: This product conforms with the ISO 1179-1 standard and the ISO 228-1 standard.

- ⚡ - Note

- The end-position lock should only be operated in conjunction with double-acting exhaust-air restricted cylinders in order to ensure that the lock is always completely released prior to starting the drive movement.

- No screws with a head or similar may be used in place of the end-position lock, as there is a risk that the function will be impaired if they are screwed in too deeply.
- The exhaust hole must not be closed.

- Locking can be performed from any stroke position once the drive is brought mechanically into its end position.
- The end-position lock has been designed to prevent the load dropping in case of pressure failure.

- An excessive end-position cushioning setting (more than 50% closed) can result in the latching bolt not engaging reliably, meaning premature wear.

# Standard cylinders DNC-EL, standard port pattern, with end-position lock

Technical data

**FESTO**

## Operating and environmental conditions

Operating medium	Filtered compressed air, lubricated or unlubricated					
Operating pressure [bar]	1.5 ... 12					
Min. release pressure [bar]	$\leq 1.5$					
Ambient temperature <sup>1)</sup> [°C]	-20 ... +80					
Corrosion resistance class CRC <sup>2)</sup>	2					
Certification	Germanischer Lloyd					

1) Note operating range of proximity sensors

2) Corrosion resistance class 2 to Festo standard 940 070

Components subject to moderate corrosion stress. Externally visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment or media such as coolants or lubricating agents

## Impact energy [J]

Piston Ø	32	40	50	63	80	100
Max. impact energy at the end positions	0.1	0.2	0.2	0.5	0.9	1.2

Permissible impact velocity:

$$v_{\text{perm.}} = \sqrt{\frac{2 \times E_{\text{perm.}}}{m_{\text{dead}} + m_{\text{load}}}}$$

Note

This data represents the maximum values that can be achieved. Values will vary in practice depending on the size of the effective load. Allowance

must also be made for the limits of the cushioning capacity of the drive and the permissible impact energy.

Maximum permissible load:

$$m_{\text{load}} = \frac{2 \times E_{\text{perm.}}}{v^2} - m_{\text{dead}}$$

## Forces [N]

Piston Ø	32	40	50	63	80	100
Theoretical force at 6 bar, advancing	483	754	1,178	1,870	3,016	4,712
Theoretical force at 6 bar, retracting	415	633	990	1,682	2,721	4,418
Static holding force	500		2,000		5,000	

### Sizing example

Note

When sizing pneumatic cylinders it is recommended as a basic principle that only 50% of the indicated theoretical forces (see above) be used.

#### Given:

Installation position = Vertical

Workpiece load = 44 kg

$$F = m \times g = 44 \text{ kg} \times 9.81 \text{ m/s}^2 = 431.6 \text{ N}$$

#### To be calculated:

Suitable piston Ø

#### Analysis with 32 mm piston Ø:

Theoretical force at 6 bar, advancing = 483 N

50% of the theoretical force = 241.5 N

Static holding force with 32 mm piston Ø = 500 N

The static force on the end-position lock is within the permissible range (max. 500 N) with a workpiece load of 44 kg (431.6 N), however the cylinder would be at 89% capacity.

#### Result:

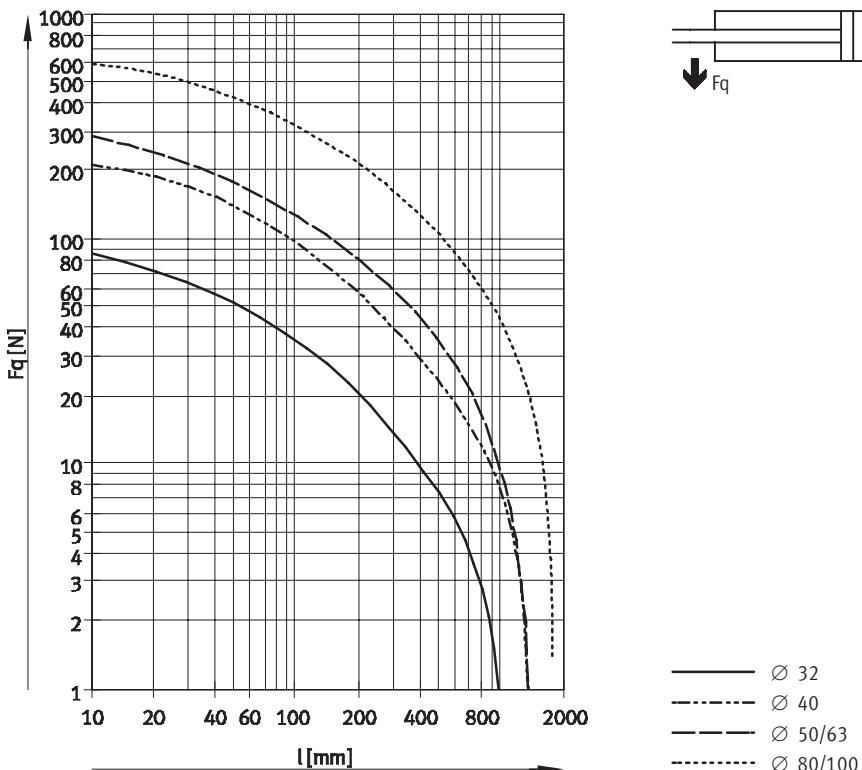

A cylinder with a piston Ø of 40 mm is therefore recommended for this application.

Max. impact energy at the end positions <sup>1)</sup>	0.1	0.2	0.2	0.5	0.9	1.2

1) The permitted impact energy is reduced by approx. 10% for variants K10 and S20

Permissible impact velocity:  $v_{\text{perm.}} = \sqrt{\frac{2 \times E_{\text{perm.}}}{m_{\text{dead}} + m_{\text{load}}}}$

Maximum permissible load:  $m_{\text{load}} = \frac{2 \times E_{\text{perm.}}}{v^2} - m_{\text{dead}}$

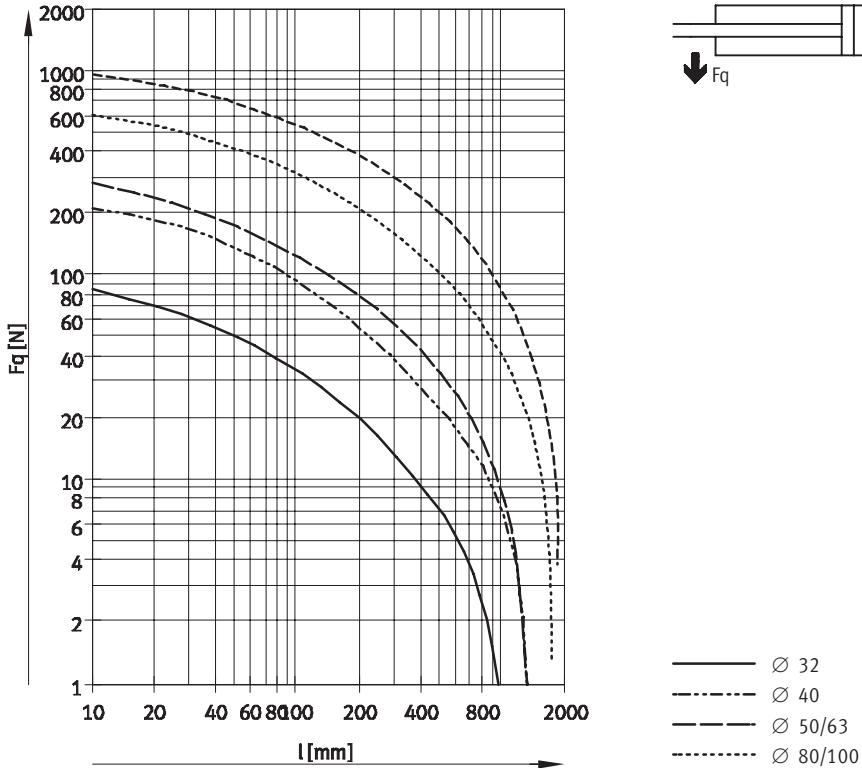

## Note

This data represents the maximum values that can be achieved. Values will vary in practice depending on the size of the effective load. Allowance

must also be made for the limits of the cushioning capacity of the drive and the permissible impact energy.

### Connecting two cylinders with identical piston Ø as a 3 or 4-position cylinder

A 3 or 4-position cylinder consists of two separate cylinders whose piston rods advance in opposing directions.

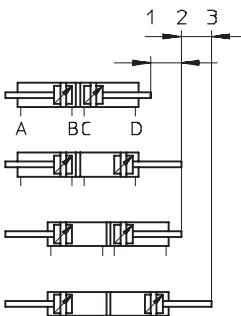

This means that depending upon actuation and stroke pattern, this type of cylinder can assume up to four

positions. In each case the cylinder is driven precisely against a stop. Note that when one end of the piston rod is

fixed, the cylinder barrel executes the movement. The cylinder must be connected with flexible line connections.

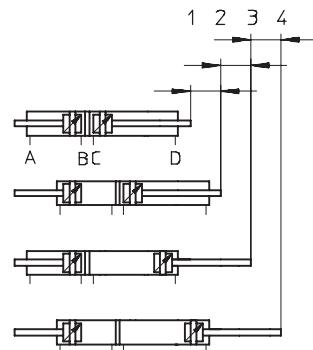

#### To achieve 3 positions

Two cylinders with identical stroke length must be connected together.

#### To achieve 4 positions

Two cylinders with different stroke lengths must be connected together.

1) Corrosion resistance class 2 to Festo standard 940 070

Components subject to moderate corrosion stress. Externally visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment or media such as coolants or lubricating agents

### Trunnion support CRLNZG

Material:

High-alloy steel

Free of copper, PTFE and silicone
